

Ingarden mechanical systems with special external forces

Otilia Lungu and Valer Nîminet

Abstract

In the present paper we study a remarkable particular case of Finslerian mechanical system, called Ingarden mechanical system. This is defined by a 4-uple $\sum_{IF^n} = (M, F^2, N, F_e)$ where M is the configuration space, $F^n = (M, F(x, y)) = (M, \alpha(x, y) + \beta(x, y))$ is an Ingarden space, N is the Lorentz nonlinear connection and $F_e = a_{jk}^i(x) y^j y^k \frac{\partial}{\partial y^i}$ are the external forces.

One associates to this system \sum_{IF^n} a semispray S , or a dynamical system on the velocity space TM. We write the generalized Maxwell equations for the electromagnetic fields of \sum_{IF^n} .

1 Introduction

The general theory of Finslerian mechanical systems was realized by R. Miron [9], [10] and proceeds from the Finsler geometry. It started with Finsler's dissertation in 1918 and its study has been developed by geometers and physicists as: E.Cartan, H.Rund, L.Berwald, S.S.Chern, M.Matsumoto, R.Miron, H.Shimada, G.S.Asanov, etc.

In this paper we introduce and investigate some geometric aspects of a special kind of Finslerian mechanical systems.

We define a 4-uple $\sum_{IF^n} = (M, F^2, N, F_e)$ where M is the configuration space, $F = \alpha + \beta$ is a Randers metric F^2 is the kinetic energy of the space, N

Key Words: Mechanical system, Ingarden space, Lorentz connection, Euler-Lagrange equations.

is the Lorentz nonlinear connection and $F_e = a_{jk}^i(x) y^j y^k \frac{\partial}{\partial y^i}$ are the external forces with $a_{jk}^i(x)$ a symmetric tensor on M of type $(1, 2)$.

We call this 4-uple an Ingarden mechanical system with special external forces and we determine the coefficients of the canonical nonlinear connection ^{MI}N . We also construct the canonical metrical d-connection $^{MI}MIT(N)$ of \sum_{IF^n} and we write the generalized Maxwell equations.

Let M be an n -dimensional, real C^∞ manifold. Denote by (TM, τ, M) the tangent bundle of M and $F^n = (M, F(x, y))$ be a Finsler space, where $F : TM \rightarrow R_+$ is its fundamental function, i.e., F verifies the following axioms:

i) F is a differentiable function on $\tilde{TM} = TM \setminus \{0\}$ and it is continuous on the null section of the projection $\tau : TM \rightarrow M$;

ii) F is positively 1-homogeneous with respect to the variables y^i ;

iii) $\forall (x, y) \in \tilde{TM}$ the Hessian of F^2 with respect y^i is positive defined.

Consequently, the d-tensor field $g_{ij}(x, y) = \frac{1}{2} \frac{\partial^2 F^2}{\partial y^i \partial y^j}$ is positive defined. It is called the fundamental tensor, or metric tensor of F^n .

This definition can be extended to the case when the fundamental tensor is of constant signature, when we imposed the condition $\det(g_{ij}(x, y)) \neq 0$.

It is well known that a Randers metric is a deformation of a Riemannian or pseudo-Riemannian metric $\alpha(x, y) = \sqrt{a_{ij}(x) y^i y^j}$, showing the gravitational field, using a 1-form $\beta(x, y) = b_i(x) y^i$, representing the electromagnetic field. Randers spaces are Finsler spaces $F^n = (M, F(x, y)) = (M, \alpha(x, y) + \beta(x, y))$ equipped with Cartan nonlinear connection. For F^n , instead of the Cartan nonlinear connection, R. Miron introduced in [8] the Lorentz nonlinear connection N determined by the Lorentz equations of the space F^n with the metric $F(x, y) = \alpha(x, y) + \beta(x, y)$. The local coefficients of N are $N_j^i = \gamma_{jk}^i y^k - F_j^i$, where γ_{jk}^i are the Christoffel symbols of the Riemannian structure $a = a_{ij}(x) dx^i \otimes dx^j$ and $F_j^i(x) = a^{is} F_{sj}$, $F_{sj} = \frac{\partial b_s}{\partial x^j} - \frac{\partial b_j}{\partial x^s}$. The Finsler space $F^n = (M, F(x, y)) = (M, \alpha(x, y) + \beta(x, y))$ equipped with the Lorentz nonlinear connection N is called an Ingarden space. It is denoted $IF^n = (F^n, N)$.

In Preliminaries we give some known results regarding the Lorentz nonlinear connection and Ingarden spaces.

In section 3 we present main results and in section 4 some applications in physical fields.

2 Preliminaries

Let $F^n = (M, F(x, y))$ be a Finsler space with the fundamental function $F(x, y) = \alpha(x, y) + \beta(x, y)$ where $\alpha(x, y) = \sqrt{a_{ij}(x) y^i y^j}$ and $\beta(x, y) = b_i(x) y^i$; $a = a_{ij}(x) dx^i \otimes dx^j$ is a pseudo-Riemannian metric on M and it gives

the gravitational part of the metric F ; $b_i(x)$ is an electromagnetic covector on M and $\beta(x, dx) = b_i(x) dx^i$ is the electromagnetic 1-form field on M . We consider the integral of action of the energy $F^2(x, y)$ along a curve $c : t \in [0, 1] \rightarrow c(t) \in M$:

$$I(c) = \int_0^1 F^2(x, \frac{dx}{dt}) dt = \int_0^1 [\alpha(x, \frac{dx}{dt}) + \beta(x, \frac{dx}{dt})]^2 dt \quad (1)$$

The variational problem for $I(c)$ leads to the Euler-Lagrange equations:

$$E_i(F^2) := \frac{\partial(\alpha+\beta)^2}{\partial x^i} - \frac{d}{dt} \frac{\partial(\alpha+\beta)^2}{\partial y^i} = 0, y^i = \frac{dx^i}{dt}. \quad (2)$$

The energy of F^2 is

$$\varepsilon_{F^2} = y^i \frac{\partial F^2}{\partial y^i} - F^2 = 2F^2 - F^2 = F^2. \quad (3)$$

The covector field $E_i(F^2)$ is expressed by

$$E_i(F^2) = E_i(\alpha^2) + 2\alpha E_i(\beta) + 2 \frac{d\alpha}{dt} \frac{\partial \alpha}{\partial y^i}. \quad (4)$$

Let us fix a parametrization of the curve c , by natural parameter s with respect to Riemannian metric $\alpha(x, y)$. It is given by

$$ds^2 = \alpha^2(x, \frac{dx}{dt}) dt^2. \quad (5)$$

It follows $F^2(x, \frac{dx}{ds}) = 1$ and $\frac{d\alpha}{ds} = 0$.

Along to an extremal curve c , canonical parametrized by (5), $E_i(\beta)$ is expressed by

$$E_i(\beta) = \left(\frac{\partial b_j}{\partial x^i} - \frac{\partial b_i}{\partial x^j} \right) \frac{dx^j}{ds} = F_{ij}(x) \frac{dx^j}{ds}. \quad (6)$$

One obtains [6]:

Theorem 2.1. (Miron-Hassan) *In the canonical parametrization, the Euler-Lagrange equations of the Lagrangian $(\alpha + \beta)^2$ are given by*

$$E_i(\alpha^2) + 2F_{ij}(x) y^j = 0, y^i = \frac{dx^i}{ds}. \quad (7)$$

Theorem 2.2. *The Euler-Lagrange equations (7) are equivalent to the Lorentz equations:*

$$\frac{d^2 x^i}{ds^2} + \gamma_{jk}^i(x) \frac{dx^j}{ds} \frac{dx^k}{ds} = \overset{\circ}{F}_j^i(x) \frac{dx^j}{ds}, \quad (8)$$

where $\overset{\circ}{F}_j^i(x) = a^{is} F_{sj}(x)$ and γ_{jk}^i are the Christoffel symbols of the Riemannian metric tensor $a_{ij}(x)$.

The Euler-Lagrange equations $E_i(F^2) = 0$ determines a canonical semispray or a Dynamical System S on the total space of the tangent bundle :

$$S = y^i \frac{\partial}{\partial x^i} - 2G^i \frac{\partial}{\partial y^i}, \quad (9)$$

where the coefficients $G^i(x, y)$ are:

$$2G^i(x, y) = \gamma_{jk}^i(x) y^j y^k - \overset{\circ}{F}_j^i(x) y^j. \quad (10)$$

Now we can consider the nonlinear connection N with the coefficients $N_j^i = \frac{\partial G^i}{\partial y^j}$. Of course, we have

$$N_j^i = \gamma_{jk}^i(x) y^k - F_j^i(x), \quad (11)$$

where $F_j^i(x) = \frac{1}{2} \overset{\circ}{F}_j^i(x)$.

Since the autoparallel curves of N are given by the Lorentz equations (8), we call it the Lorentz nonlinear connection of the Randers metric $\alpha + \beta$.

The nonlinear connection N determines the horizontal distribution, denoted by N too, with the property $T_u TM = N_u \oplus V_u$, $\forall u \in TM$, V_u being the natural vertical distribution on the tangent manifold TM .

The local adapted basis to the horizontal and vertical vector spaces N_u and V_u is given by $\left(\frac{\delta}{\delta x^i}, \frac{\partial}{\partial y^i} \right)$, $i = 1, \dots, n$, where

$$\frac{\delta}{\delta x^i} = \frac{\partial}{\partial x^i} - N_i^k \frac{\partial}{\partial y^k} = \frac{\partial}{\partial x^i} - \gamma_{is}^k(x) y^s \frac{\partial}{\partial y^k} + F_i^k \frac{\partial}{\partial y^k} = \frac{\overset{\circ}{\delta}}{\delta x^i} + F_i^k \frac{\partial}{\partial y^k} \quad (12)$$

and $\frac{\overset{\circ}{\delta}}{\delta x^i} = \frac{\partial}{\partial x^i} - \gamma_{is}^k(x) y^s \frac{\partial}{\partial y^k}$.

The adapted cobasis is $(dx^i, \delta y^i)$, $i = 1, \dots, n$ with

$$\delta y^i = dy^i + N_j^i dx^j = dy^i + \gamma_{jk}^i(x) y^k dx^j - F_j^i dx^j = \overset{\circ}{\delta} y^i - F_j^i dx^j, \quad (13)$$

where $\overset{\circ}{\delta} y^i = dy^i + \gamma_{jk}^i(x) y^k dx^j$.

The weakly torsion of N is

$$T_{jk}^i = \frac{\partial N_j^i}{\partial y^k} - \frac{\partial N_k^i}{\partial y^j} = 0. \quad (14)$$

The integrability tensor of N is

$$R_{jk}^i = \frac{\delta N_j^i}{\delta x^k} - \frac{\delta N_k^i}{\delta x^j}. \quad (15)$$

Definition 2.1. The Finsler space $F^n = (M, F = \alpha + \beta)$ equipped with the Lorentz nonlinear connection N is called an Ingarden space. It is denoted IF^n .

The fundamental tensor g_{ij} of IF^n is

$$g_{ij} = \frac{F}{\alpha} (a_{ij} - \tilde{l}_i \tilde{l}_j) + l_i l_j \quad (16)$$

where $\tilde{l}_i = \frac{\partial \alpha}{\partial y^i}$, $l_i = \frac{\partial F}{\partial y^i}$, $l_i = \tilde{l}_i + b_i$.

The following results holds [8]:

Theorem 2.3. There exists an unique N -metrical connection $I\Gamma(N) = (F_{jk}^i, C_{jk}^i)$ of the Ingarden space IF^n which verifies the following axioms:

- i) $\nabla_k^H g_{ij} = 0$; $\nabla_k^V g_{ij} = 0$;
- ii) $T_{jk}^i = 0$; $S_{jk}^i = 0$.

The connection $I\Gamma(N)$ has the coefficients expressed by the generalized Christoffel symbols:

$$\begin{cases} F_{jk}^i = \frac{1}{2} g^{is} \left(\frac{\delta g_{sj}}{\delta x^k} + \frac{\delta g_{sk}}{\delta x^j} - \frac{\delta g_{jk}}{\delta x^s} \right) \\ C_{jk}^i = \frac{1}{2} g^{is} \left(\frac{\partial g_{sj}}{\partial y^k} + \frac{\partial g_{sk}}{\partial y^j} - \frac{\partial g_{jk}}{\partial y^s} \right), \end{cases} \quad (17)$$

where $\frac{\delta}{\delta x^i}$ are given by (12).

3 Main results

For a manifold M , that is the configuration space of a Finslerian dynamical system, let us consider the tangent bundle TM to which we refer to as the velocity space. Suppose that there exists a Randers metric $F = \alpha + \beta$ on TM and $a_{jk}^i(x)$ a symmetric tensor on the configuration space M , of type $(1, 2)$.

Definition 3.1. An Ingarden mechanical system with special external forces is a 4-uple

$$\sum_{IF^n} = (M, (\alpha + \beta)^2, N, F_e),$$

with N , the Lorentz nonlinear connection and $F_e = a_{jk}^i(x) y^j y^k \frac{\partial}{\partial y^i}$ the external forces given as a vertical vector field globally defined on TM .

We denote $F^i(x, y) = a_{jk}^i(x) y^j y^k$ and we can state

Theorem 3.1. [9] For the Ingarden mechanical system

$\sum_{IF^n} = (M, (\alpha + \beta)^2, N, F_e)$ the following properties hold good:

- i) The operator S defined by

$$S = y^i \frac{\partial}{\partial x^i} - (2G^i - \frac{1}{2} F^i) \frac{\partial}{\partial y^i} \quad (18)$$

is a vector field, global defined on the velocity space TM .

ii) S is a semispray which depends only on \sum_{IF^n} and it is a spray if F_e are 2-homogeneous with respect to y^i .

iii) The integral curves of the vector field S are the evolution curves given by the Lagrange equations of \sum_{IF^n} :

$$\frac{d^2 x^i}{dt^2} + \Gamma_{jk}^i \left(x, \frac{dx}{dt} \right) \frac{dx^j}{dt} \frac{dx^k}{dt} = \frac{1}{2} F^i \left(x, \frac{dx}{dt} \right). \quad (19)$$

The semispray S (18) has the coefficients $\overset{MI}{G}^i$ expressed by

$$2 \overset{MI}{G}^i = 2G^i - \frac{1}{2} F^i(x, y) = \Gamma_{jk}^i(x, y) y^j y^k - \frac{1}{2} F^i(x, y). \quad (20)$$

Thus, the canonical nonlinear connection $\overset{MI}{N}$ of the Ingarden mechanical system \sum_{IF^n} has the coefficients

$$\overset{MI}{N}_j^i = \frac{\partial \overset{MI}{G}^i}{\partial y^j} = N_j^i - \frac{1}{4} \frac{\partial F^i}{\partial y^j} = N_j^i - \frac{1}{2} a_{jk}^i(x) y^k. \quad (21)$$

This nonlinear connection $\overset{MI}{N}$ determines a direct decomposition of the tangent space $T\tilde{M}$ into horizontal and vertical subspaces:

$$T_u T\tilde{M} = \overset{MI}{N}_u \oplus V_u, \forall u \in T\tilde{M}. \quad (22)$$

A local adapted basis to this decomposition is $\left(\overset{MI}{\delta} \frac{\partial}{\partial x^i}, \overset{MI}{\delta} \frac{\partial}{\partial y^i} \right)_{i=\overline{1, n}}$ where

$$\overset{MI}{\delta} \frac{\partial}{\partial x^i} = \overset{\circ}{\delta} \frac{\partial}{\partial x^i} + \left(F_i^j(x) + \frac{1}{2} a_{ik}^j(x) y^k \right) \frac{\partial}{\partial y^j} = \overset{\circ}{\delta} \frac{\partial}{\partial x^i} + A_i^j \frac{\partial}{\partial y^j} \quad (23)$$

with

$$A_i^j = F_i^j(x) + \frac{1}{2} a_{ik}^j(x) y^k \quad (24)$$

and $\overset{\circ}{\delta} \frac{\partial}{\partial x^i} = \frac{\partial}{\partial x^i} - \gamma_{is}^k(x) y^s \frac{\partial}{\partial y^k}$.

The adapted cobasis is $\left(dx^i, \overset{MI}{\delta} y^i \right)$ with

$$\overset{MI}{\delta} y^i = \overset{\circ}{\delta} y^i - \left(F_j^i + \frac{1}{2} a_{jk}^i(x) y^k \right) dx^j = \overset{\circ}{\delta} y^i - A_j^i dx^j \quad (25)$$

where $\overset{\circ}{\delta} y^i = dy^i + \gamma_{jk}^i(x) y^k dx^j$.

We determine the torsion T_{jk}^{MI} and the curvature R_{jk}^{MI} of the canonical connection N^{MI} by a direct calculation:

$$T_{jk}^{MI} = \frac{\partial N_j^i}{\partial y^k} - \frac{\partial N_k^i}{\partial y^j} = 0 \quad (26)$$

$$R_{jk}^{MI} = \frac{\delta}{\delta y^k} \frac{MI}{\delta} N_j^i - \frac{MI}{\delta} \frac{\delta}{\delta y^j} N_k^i = R_{jk}^{\circ} + \left(A_k^j \frac{\partial N_j^i}{\partial y^j} - A_j^k \frac{\partial N_k^i}{\partial y^j} \right), \quad (27)$$

where we have denoted $R_{jk}^{\circ} = \frac{\delta}{\delta x^k} \frac{\delta}{\delta} N_j^i - \frac{\delta}{\delta x^j} \frac{\delta}{\delta} N_k^i$.

Applying the theory from the book [10] the following theorem holds:

Theorem 3.2. *Let $\sum_{IF^n} = (M, (\alpha + \beta)^2, F_e)$ be an Ingarden mechanical system and N^{MI} the canonical nonlinear connection of \sum_{IF^n} . There exists an unique d-connection $MI\Gamma \left(\frac{MI}{N} \right) = \left(\frac{MI}{F_{jk}^i}, \frac{MI}{C_{jk}^i} \right)$ determined by the following axioms:*

- i) $\nabla_k^{MIH} g_{ij} = 0; \nabla_k^{MIV} g_{ij} = 0,$
 - ii) $T_{jk}^{MI} = 0; S_{jk}^{MI} = 0,$
- where

$$\begin{aligned} \nabla_k^{MIH} g_{ij} &= \frac{\delta}{\delta x^k} g_{ij} - F_{ik}^s g_{sj} - F_{jk}^s g_{is} \\ \nabla_k^{MIV} g_{ij} &= \frac{\partial g_{ij}}{\partial y^k} - C_{ik}^s g_{sj} - C_{jk}^s g_{is} \end{aligned} \quad (28)$$

We call this connection the canonical metrical d-connection of \sum_{IF^n} .

Theorem 3.3. *The local coefficients of the canonical metrical d-connection of \sum_{IF^n} are*

$$\begin{cases} F_{jk}^i = \frac{1}{2} g^{is} \left(\frac{\delta}{\delta x^k} g_{sj} + \frac{\delta}{\delta x^j} g_{sk} - \frac{\delta}{\delta x^s} g_{jk} \right) \\ C_{jk}^i = \frac{1}{2} g^{is} \left(\frac{\partial g_{sj}}{\partial y^k} + \frac{\partial g_{sk}}{\partial y^j} - \frac{\partial g_{jk}}{\partial y^s} \right). \end{cases} \quad (29)$$

In order to calculate F_{jk}^{MI} and C_{jk}^{MI} we have:

$$\frac{\overset{MI}{\delta} g_{sj}}{\delta x^k} = \overset{\circ}{\delta} \frac{g_{sj}}{\delta x^k} + A_k^r \frac{\partial g_{sj}}{\partial y^r} \quad (30)$$

Denote $\overset{\circ}{\nabla}_k$ the h -covariant derivative with respect to Levi-Civita connection:

$$\overset{\circ}{\nabla}_k g_{sj} = \overset{\circ}{\delta} \frac{g_{sj}}{\delta x^k} - \gamma_{sk}^i g_{ij} - \gamma_{jk}^i g_{si}. \quad (31)$$

We get

$$\frac{\overset{\circ}{\delta} g_{sj}}{\delta x^k} = \overset{\circ}{\nabla}_k g_{sj} + \gamma_{sk}^i g_{ij} + \gamma_{jk}^i g_{si} \quad (32)$$

Now we obtain

$$\frac{\overset{MI}{\delta} g_{sj}}{\delta x^k} = \overset{\circ}{\nabla}_k g_{sj} + \gamma_{sk}^i g_{ij} + \gamma_{jk}^i g_{si} + A_k^r \frac{\partial g_{sj}}{\partial y^r} \quad (33)$$

and we can state:

Theorem 3.4. *The canonical metrical d -connection of \sum_{IF^n} has the coefficients*

$$\begin{cases} \overset{MI}{F}_{jk}^i = \gamma_{jk}^i + B_{jk}^i \\ \overset{MI}{C}_{jk}^i = C_{jk}^i \end{cases} \quad (34)$$

where

$$B_{jk}^i = \frac{1}{2} g^{is} \left[\left(\overset{\circ}{\nabla}_k g_{sj} + A_k^r \frac{\partial g_{sj}}{\partial y^r} \right) + \left(\overset{\circ}{\nabla}_j g_{sk} + A_j^r \frac{\partial g_{sk}}{\partial y^r} \right) - \left(\overset{\circ}{\nabla}_s g_{jk} + A_s^r \frac{\partial g_{jk}}{\partial y^r} \right) \right]. \quad (35)$$

Taking into account (33) we can express the curvature tensors of

$$MI\Gamma \begin{pmatrix} MI \\ N \end{pmatrix} = \begin{pmatrix} MI & MI \\ F_{jk}^i & C_{jk}^i \end{pmatrix}:$$

$$\begin{cases} R_{jkh}^i = \frac{\overset{MI}{\delta} \overset{MI}{F}_{jk}^i}{\delta x^h} - \frac{\overset{MI}{\delta} \overset{MI}{F}_{jh}^i}{\delta x^k} + \overset{MI}{F}_{jk}^s \overset{MI}{F}_{sh}^i - \overset{MI}{F}_{jh}^s \overset{MI}{F}_{sk}^i + \overset{MI}{C}_{hs}^i \overset{MI}{R}_{kh}^s \\ P_{jkh}^i = \frac{\partial \overset{MI}{F}_{jk}^i}{\partial y^h} - \overset{MI}{\nabla}_k^h \overset{MI}{C}_{hs}^i + \overset{MI}{C}_{js}^i \overset{MI}{P}_{kh}^s \\ S_{jkh}^i = \frac{\partial \overset{MI}{C}_{jk}^i}{\partial y^h} - \frac{\partial \overset{MI}{C}_{jh}^i}{\partial y^k} + \overset{MI}{C}_{jk}^s \overset{MI}{C}_{sh}^i - \overset{MI}{C}_{jh}^s \overset{MI}{C}_{sk}^i \end{cases} \quad (36)$$

$$\text{with } \overset{MI}{P}_{jk}^i = \frac{\partial \overset{MI}{N}_j^i}{\partial y^k} - \overset{MI}{F}_{jk}^i.$$

4 Applications in physical fields

In an Ingarden mechanical system the h -deflection tensor D_k^i of the canonical metrical connection no vanishes. It give rise to an interior electromagnetic tensor which is not coincident to the exterior electromagnetic tensor $F_{ik}(x)$ provided by β .

The h -deflection tensor D_k^i is given by

$$D_k^i = \nabla_k^H y^i = \frac{\delta y^i}{\delta x^k} + F_{kj}^i y^j = B_{jk}^i y^j + A_k^i \quad (37)$$

From the relation

$$B_{jk}^i y^j = \frac{1}{2} g^{is} y^j \left(\overset{\circ}{\nabla}_k g_{sj} + \overset{\circ}{\nabla}_j g_{sk} - \overset{\circ}{\nabla}_s g_{jk} \right) + \frac{1}{2} g^{is} A_j^r \frac{\partial g_{sk}}{\partial y^r} y^j \quad (38)$$

we get

$$D_k^i = \frac{1}{2} g^{is} y^j \left(\overset{\circ}{\nabla}_k g_{sj} + \overset{\circ}{\nabla}_j g_{sk} - \overset{\circ}{\nabla}_s g_{jk} \right) + \frac{1}{2} g^{is} A_j^r \frac{\partial g_{sk}}{\partial y^r} y^j + A_k^i. \quad (39)$$

The v -deflection tensor d_k^i is

$$d_k^i = \nabla_k^V y^i = \delta_k^i. \quad (40)$$

The covariant h -tensor is

$$D_{sk}^{MI} = g_{is} D_k^i = \frac{1}{2} y^j \left(\overset{\circ}{\nabla}_k g_{sj} + \overset{\circ}{\nabla}_j g_{sk} - \overset{\circ}{\nabla}_s g_{jk} \right) + \frac{1}{2} A_j^r \frac{\partial g_{sk}}{\partial y^r} y^j + g_{is} A_k^i. \quad (41)$$

and the covariant v -tensor is

$$d_{sk}^{MI} = g_{is} d_k^i. \quad (42)$$

The h -interior electromagnetic tensor \tilde{F}_{sk} is

$$\tilde{F}_{sk} = \frac{1}{2} \left(D_{sk}^{MI} - D_{ks}^{MI} \right). \quad (43)$$

and the v -interior electromagnetic tensor \tilde{f}_{sk} is

$$\tilde{f}_{sk} = \frac{1}{2} \left(d_{sk}^{MI} - d_{ks}^{MI} \right) \quad (44)$$

A direct calculus allows to formulate:

Theorem 4.1. *The h - and v - interior electromagnetic tensors of the Ingarden mechanical system \sum_{IF^n} with respect to the canonical metrical connection $\overset{MI}{N}$ are given by*

$$\begin{aligned} \tilde{F}_{sk} &= \frac{1}{2} y^j \left(\overset{\circ}{\nabla}_k g_{sj} - \overset{\circ}{\nabla}_s g_{jk} \right) + \frac{1}{2} (g_{is} A_k^i - g_{ik} A_s^i) \\ \tilde{f}_{sk} &= 0. \end{aligned} \quad (45)$$

We denote $\overset{MI}{R}_{ijk} = g_{is} \overset{MI}{R}_{jk}^s$, $\overset{MI}{R}_{ijkh} = g_{js} \overset{MI}{R}_{ikh}^s$, $\overset{MI}{P}_{ijk} = g_{is} \overset{MI}{P}_{jk}^s$, $\overset{MI}{P}_{ijkh} = g_{js} \overset{MI}{P}_{ikh}^s$.

By a direct calculus one proves:

Theorem 4.2. *The h - interior electromagnetic tensors \tilde{F}_{ij} of the Ingarden mechanical system \sum_{IF^n} satisfies the following generalized Maxwell equations:*

$$\begin{aligned} \overset{MI}{\nabla}_k^H \tilde{F}_{ij} + \overset{MI}{\nabla}_i^H \tilde{F}_{jk} + \overset{MI}{\nabla}_j^H \tilde{F}_{ki} &= \frac{1}{2} \left\{ y^r \left(\overset{MI}{R}_{rijk} + \overset{MI}{R}_{rjki} + \overset{MI}{R}_{rki j} \right) - \left(\overset{MI}{R}_{ijk} + \overset{MI}{R}_{jki} + \overset{MI}{R}_{kij} \right) \right\} \\ \overset{MI}{\nabla}_k^V \tilde{F}_{ij} + \overset{MI}{\nabla}_i^V \tilde{F}_{jk} + \overset{MI}{\nabla}_j^V \tilde{F}_{ki} &= \frac{1}{2} \left\{ y^r \left[\left(\overset{MI}{P}_{rijk} - \overset{MI}{P}_{rikj} \right) + \left(\overset{MI}{P}_{rjki} - \overset{MI}{P}_{rjik} \right) + \left(\overset{MI}{P}_{rkij} - \overset{MI}{P}_{rkji} \right) \right] \right\} \end{aligned} \quad (46)$$

Conclusions. We defined in this paper a new kind of mechanical systems, called Ingarden mechanical system with special external forces. We developed the theory using the geometrical objects fields of the canonical metrical d-connection. After the calculation of the h - and v -interior electromagnetic tensors, we got a new form for the generalized Maxwell equations. The same theory can be also used to write the Einstein equation for the gravitational fields.
