# Arrow's Impossibility Theorem 

Freek Wiedijk<br>Institute for Computing and Information Sciences<br>Radboud University Nijmegen<br>Toernooiveld 1, 6525 ED Nijmegen, The Netherlands

Summary. A formalization of the first proof from [6].

MML identifier: ARROW, version: 7.8.05 4.87.985

The terminology and notation used here are introduced in the following articles: [11], [13], [12], [10], [9], [5], [2], [3], [1], [8], [4], and [7].

## 1. Preliminaries

Let $A, B^{\prime}$ be non empty sets, let $B$ be a non empty subset of $B^{\prime}$, let $f$ be a function from $A$ into $B$, and let $x$ be an element of $A$. Then $f(x)$ is an element of $B$.

Next we state two propositions:
(1) For every finite set $A$ such that card $A \geq 2$ and for every element $a$ of $A$ there exists an element $b$ of $A$ such that $b \neq a$.
(2) Let $A$ be a finite set. Suppose card $A \geq 3$. Let $a, b$ be elements of $A$. Then there exists an element $c$ of $A$ such that $c \neq a$ and $c \neq b$.

## 2. Linear Preorders and Linear Orders

In the sequel $A$ denotes a non empty set and $a, b, c$ denote elements of $A$.
Let us consider $A$. The functor LinPreorders $A$ is defined by the condition (Def. 1).
(Def. 1) Let $R$ be a set. Then $R \in \operatorname{LinPreorders} A$ if and only if the following conditions are satisfied:
(i) $\quad R$ is a binary relation on $A$,
(ii) for all $a, b$ holds $\langle a, b\rangle \in R$ or $\langle b, a\rangle \in R$, and
(iii) for all $a, b, c$ such that $\langle a, b\rangle \in R$ and $\langle b, c\rangle \in R$ holds $\langle a, c\rangle \in R$.

Let us consider $A$. Note that LinPreorders $A$ is non empty.
Let us consider $A$. The functor LinOrders $A$ yielding a subset of LinPreorders $A$ is defined by:
(Def. 2) For every element $R$ of LinPreorders $A$ holds $R \in \operatorname{LinOrders} A$ iff for all $a, b$ such that $\langle a, b\rangle \in R$ and $\langle b, a\rangle \in R$ holds $a=b$.
Let $A$ be a set. One can verify that there exists an order in $A$ which is connected.

Let us consider $A$. Then LinOrders $A$ can be characterized by the condition:
(Def. 3) For every set $R$ holds $R \in \operatorname{LinOrders} A$ iff $R$ is a connected order in $A$.
Let us consider $A$. One can verify that LinOrders $A$ is non empty.
In the sequel $o, o^{\prime}$ are elements of LinPreorders $A$ and $o^{\prime \prime}$ is an element of LinOrders $A$.

Let us consider $A, o, a, b$. The predicate $a \leq_{o} b$ is defined by:
(Def. 4) $\langle a, b\rangle \in o$.
Let us consider $A, o, a, b$. We introduce $b \geq_{o} a$ as a synonym of $a \leq_{o} b$. We introduce $b<_{o} a$ as an antonym of $a \leq_{o} b$. We introduce $a>_{o} b$ as an antonym of $a \leq_{o} b$.

We now state a number of propositions:
(3) $a \leq_{o} a$.
(4) $a \leq_{o} b$ or $b \leq_{o} a$.
(5) If $a \leq_{o} b$ or $a<_{o} b$ and if $b \leq_{o} c$ or $b<_{o} c$, then $a \leq_{o} c$.
(6) If $a \leq_{o^{\prime \prime}} b$ and $b \leq_{o^{\prime \prime}} a$, then $a=b$.
(7) If $a \neq b$ and $b \neq c$ and $a \neq c$, then there exists $o$ such that $a<_{o} b$ and $b<{ }_{o} c$.
(8) There exists $o$ such that for every $a$ such that $a \neq b$ holds $b<_{o} a$.
(9) There exists $o$ such that for every $a$ such that $a \neq b$ holds $a<_{o} b$.
(10) If $a \neq b$ and $a \neq c$, then there exists $o$ such that $a<_{o} b$ and $a<_{o} c$ and $b<_{o} c$ iff $b<_{o^{\prime}} c$ and $c<_{o} b$ iff $c<_{o^{\prime}} b$.
(11) If $a \neq b$ and $a \neq c$, then there exists $o$ such that $b<_{o} a$ and $c<_{o} a$ and $b<_{o} c$ iff $b<_{o^{\prime}} c$ and $c<_{o} b$ iff $c<_{o^{\prime}} b$.
(12) Let $o, o^{\prime}$ be elements of LinOrders $A$. Then $a<_{o} b$ iff $a<_{o^{\prime}} b$ and $b<_{o} a$ iff $b<_{o^{\prime}} a$ if and only if $a<_{o} b$ iff $a<_{o^{\prime}} b$.
(13) Let $o$ be an element of LinOrders $A$ and $o^{\prime}$ be an element of LinPreorders $A$. Then for all $a, b$ such that $a<_{o} b$ holds $a<_{o^{\prime}} b$ if and only
if for all $a, b$ holds $a<_{o} b$ iff $a<_{o^{\prime}} b$.

## 3. Arrow's Theorem

For simplicity, we follow the rules: $A, N$ are finite non empty sets, $a, b$ are elements of $A, i, n$ are elements of $N, p, p^{\prime}$ are elements of $(\operatorname{LinPreorders} A)^{N}$, and $f$ is a function from $(\operatorname{LinPreorders} A)^{N}$ into LinPreorders $A$.

We now state the proposition
(14) Suppose that
(i) for all $p, a, b$ such that for every $i$ holds $a<_{p(i)} b$ holds $a<_{f(p)} b$,
(ii) for all $p, p^{\prime}, a, b$ such that for every $i$ holds $a<_{p(i)} b$ iff $a<_{p^{\prime}(i)} b$ and $b<_{p(i)} a$ iff $b<_{p^{\prime}(i)} a$ holds $a<_{f(p)} b$ iff $a<_{f\left(p^{\prime}\right)} b$, and
(iii) $\quad \operatorname{card} A \geq 3$.

Then there exists $n$ such that for all $p, a, b$ such that $a<_{p(n)} b$ holds $a<_{f(p)} b$.
In the sequel $p, p^{\prime}$ denote elements of $(\operatorname{LinOrders} A)^{N}$ and $f$ denotes a function from $(\text { LinOrders } A)^{N}$ into LinPreorders $A$.

One can prove the following proposition

## (15) Suppose that

(i) for all $p, a, b$ such that for every $i$ holds $a<_{p(i)} b$ holds $a<_{f(p)} b$,
(ii) for all $p, p^{\prime}, a, b$ such that for every $i$ holds $a<_{p(i)} b$ iff $a<_{p^{\prime}(i)} b$ holds $a<_{f(p)} b$ iff $a<_{f\left(p^{\prime}\right)} b$, and
(iii) $\quad \operatorname{card} A \geq 3$.

Then there exists $n$ such that for all $p, a, b$ holds $a<_{p(n)} b$ iff $a<_{f(p)} b$.
