KEYWORDS: review, parasitic, copepod, fish, Turkey.

ABSTRACT

This review presents the occurrence of 62 parasitic copepod species from 72 different fish species (64 wild, two cultured, seven from aquarium) from Turkey.

The parasite species list is arranged by providing parasite species name, host fish, location of host fish capture and author, date of published record.

All parasites and their hosts are confirmed with the recent systematic accounts and full taxonomic account according to literature and internet database. Siphonostomatoidea with 47 species and Caligidae with 12 species are the dominant order and family among parasitic copepoda with regard to species diversity, host distribution and location.

ZUSAMMENFASSUNG: Übersicht parasitärer in Fischen festgestellter Copepoden.

Vorliegende Übersicht bezieht sich auf das Vorkommen von 62 als Parasiten in 72 verschiedenen Fischarten lebender Copepoden Arten (64 wildlebende, zwei in Fischzuchtanlagen, sieben in Aquarien) in der Türkei.

Die Liste der Parasiten umfasst den Namen der parasitierenden Art, den Wirtsfisch, Fangort des Fisches, Name des Sammlers und Veröffentlichung des Belegs.

Alle Parasiten und deren Wirte werden nach den rezenten systematischen und taxonomischen Beschreibungen angegeben. Die Siphonostomatoidea sind mit 47 Arten und die Caligidae mit 12 Arten die dominanten Ordnungen und Familien unter den parasitischen Copepoden im Hinblick auf die Artendiversität, Verteilung der Wirte und der Fundorte.

Die wissenschaftlichen Namen aller Parasiten, der Wirtsfische und deren Synonyme wurden anhand von Fachliteratur und Internet Datenbanken überprüft.

REZUMAT: Recenzie copepodelor parazite pe pești înregistrate în Turcia.

Această recenzie prezintă apariția a 62 de specii parazite copepode pe un număr de 72 de specii diferite de pești din Turcia (64 sălbatic, două de cultură, sapte de acvariu).

Lista de specii parazite cuprinde numele speciilor parazite, a peștilor gazdă, locația din care au fost colectați peștii, autorul, datele publicate în care a fost semnalată apariția lor.

Toți paraziții împreună cu gazdele lor sunt confirmăți și actualizați cu cele mai recente elemente de sistematică și taxonomie în vigoare. Ordinul și familia ce domină sunt: Siphonostomatoidea cu 47 de specii și Caligidae cu 12 specii (Copepoda) cu privire la diversitatea speciilor, distribuție și areal.

Denumirile științifice ale paraziților, peștii gazdă și sinonimele lor au fost verificate după literatura de specialitate și bazele de date de pe internet.

INTRODUCTION

Parasitic crustaceans are common on fish hosts in coastal marine and also brackish waters. Three major groups of Crustacea contain fish parasites; Isopoda, Branchiura and Copepoda (Öktener and Sezgin, 2000).

Parasitic copepods belong to the suborder Siphonostomatoida (75%), some 20% to Poecilostomatoida, and only about 5% to Cyclopoida according to Kabata (1988). Parasitic copepods occur on several hosts such as the sponges, cnidarians, chinoderms chordates, sea squirts, fishes and mammals (Boxshall, 2005). Parasitic copepods damage their hosts directly by their attachment mechanisms and by their feeding activities. Infestation by any parasitic copepod may result in loss of condition of the host (Boxshall, 2005). Lester and Hayward (2006) explained effect on host, morphology and life cycle, infection of different parasitic copepods on freshwater and marine habitats.

In Turkey, the total length of the sea coast is 8,333 km, having the Black Sea, the Mediterranean Sea, the Aegean Sea and the Marmara Sea. Among these, the Black and Mediterranean shores have no recessed-protruding structures, instead the Aegean Sea has indented coastline, including bays, gulfs, deltas and islands. The Marmara Sea connects the Mediterranean Sea to the Black Sea (Kılıç, 1999).

The examination of literature on marine and inland water habitats (lake, river) of Turkey by Bilecenoglu et al. (2014), Çiçek et al. (2015) has revealed the report of 512 marine fish species and 368 freshwater fish species.

This review plans to show the parasitic copepods reported from marine, freshwater, and aquarium fish of Turkey.

MATERIAL AND METHODS

Information from all available references on parasitic copepod of fishes in Turkey (journal publications, reports of research projects, thesis, proceedings of congress, symposium proceedings) from 1931 to 2015 was gathered to provide parasite-host lists.

The scientific names of all parasites, host fishes and their synonyms were checked according to Bilecenoglu et al. (2014), Çiçek et al. (2015) and the electronic sites; Eschmeyer (2015); Froese and Pauly (2015), ITIS (2015); WoRMS Editorial Board (2015), concerning with the classification (Tabs. 1 and 2).

RESULTS

Review list on parasitic copepod of fish from Turkey is arranged by providing parasite species name, host fish, location of host fish capture, infestation site and author, date of published record (Tab. 3). Although parasitic copepods at species and genera level were reported from marine fish, only species level will be considered here.

This review presents the occurrence of 62 parasitic copepod species from 72 different fish species (64 wild, two cultured, seven from aquarium) of Turkey.

Diversity of parasitic copepods according to order are as follows: Cyclopoida with two species; Poecilostomatoida with 14 species; Siphonostomatoida with 46 species (Fig. 1).

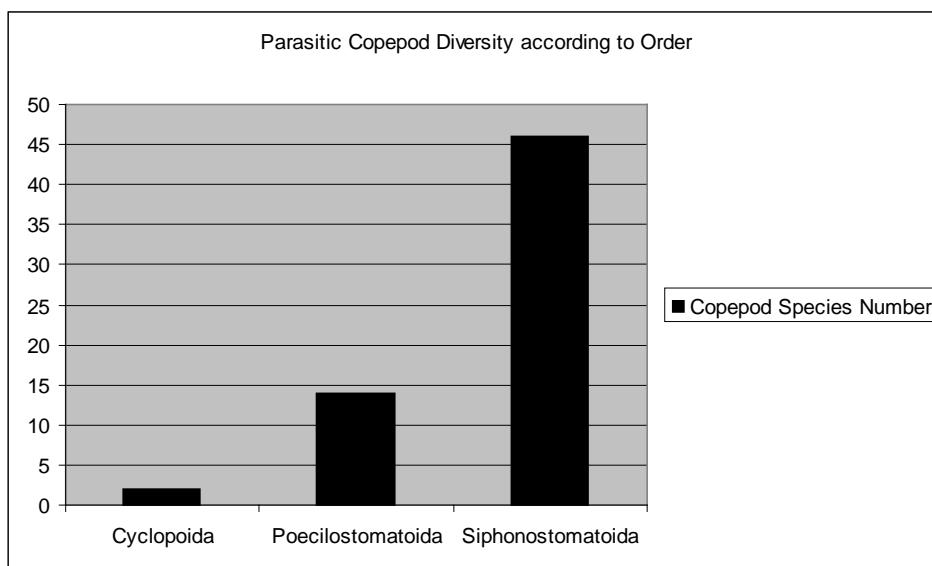

Figure 1: Parasitic copepod species diversity according to order.

Five families are dominant in terms of diversity of parasitic copepods according to family such as: Lernaeopodidae with 15 species, Caligidae with 12 species, Lernanthropidae with 10 species, Ergasilidae with nine species, Pennellidae with six species (Fig. 2).

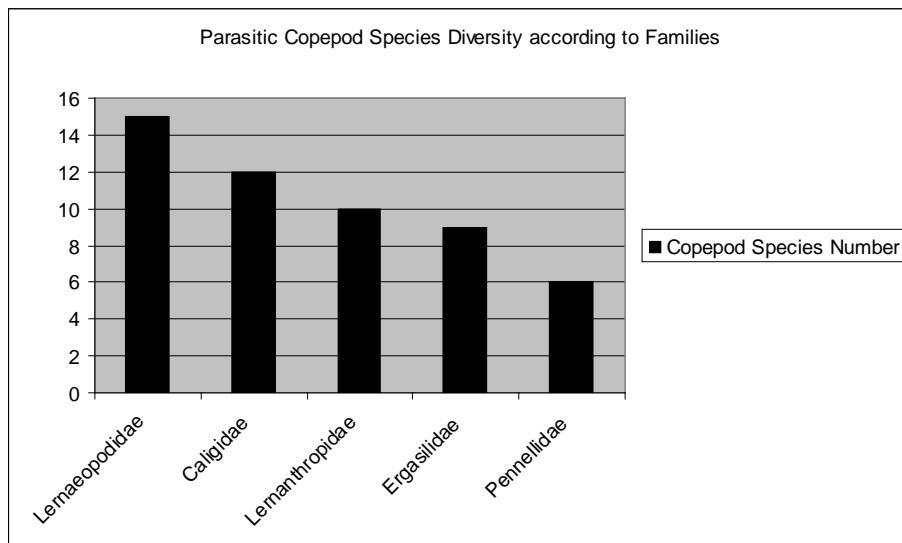

Figure 2: Parasitic copepod species diversity according to dominant families.

Reports of parasitic copepods from Turkey are compatible according to literature in terms of infestation site on host fishes such as caligid from gill filaments, body surface, lernanthropids from gill filaments.

Ergasilidae species were reported from 25 different host fish species; Lernaeidae from 16 different host fish species; Caligidae from 15 different host fish species; Lernaeopodidae from 15 different host fish species; Lernanthropidae from eight different host fish species and Pennellidae from six different host fish species (Fig. 3).

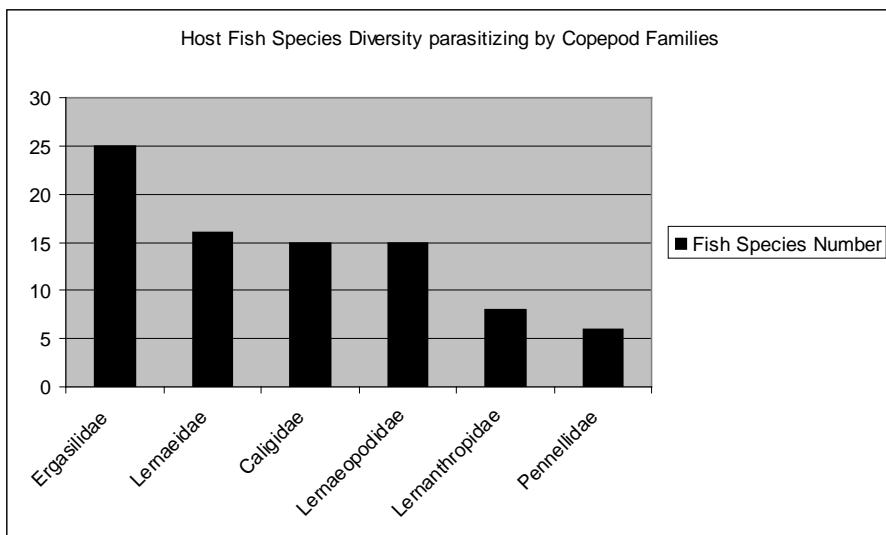

Figure 3: Host fish species diversity parasitizing by copepod families.

Parasitic copepods were reported 40 marine fish species; 20 freshwater host species; seven aquarium fish; three transitional species; two culture fish species. Only two copepod species (*Lernaeopoda galei*, *Pandarus bicolor*) were recorded as parasitic on the two chondrichthyans species (Fig. 4).

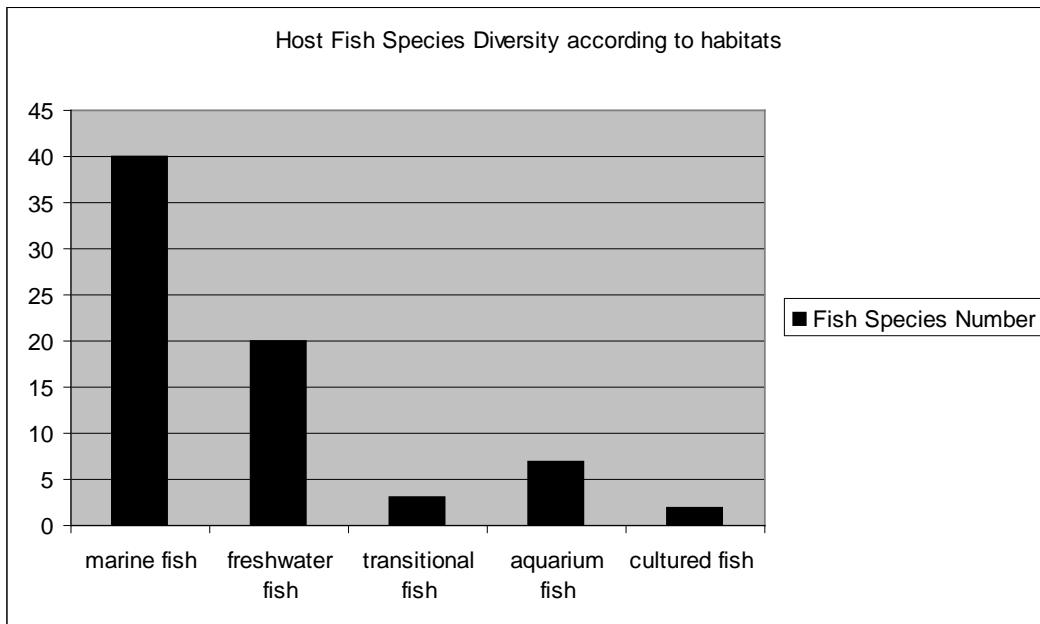

Figure 4: Host fish species diversity examined according to habitats.

Host species belonged to the following functional group categories: one benthopelagic, 21 demersal, 11 pelagic species (Fig. 5).

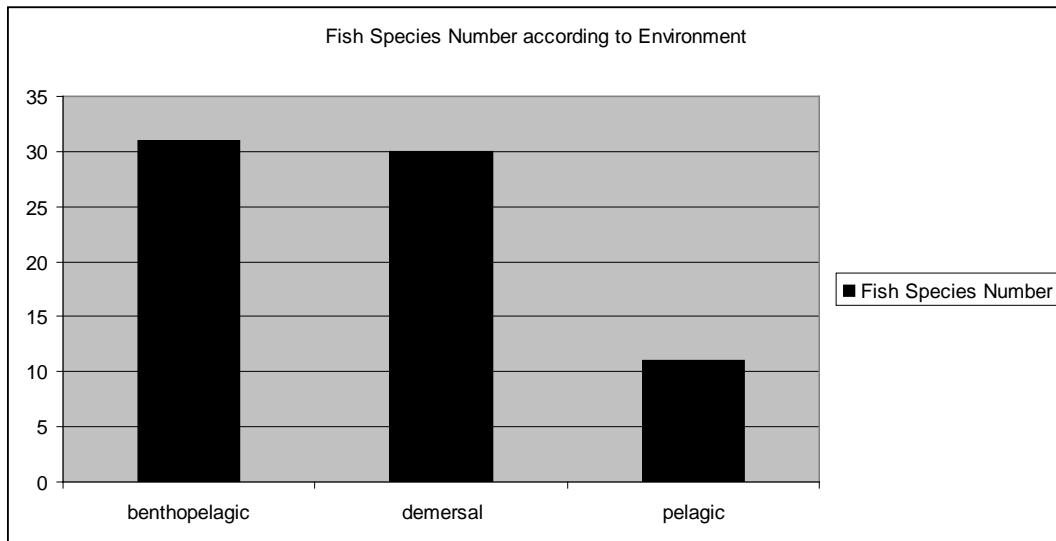

Figure 5: Host fish species diversity examined according to functional group.

CONCLUSIONS

The parasitic copepods are one of the most important enemies of fish. There were done several studies about parasitic copepods in Turkey. This review is aimed to update the species list of the parasitic copepods reported from host fish in aquarium and farm conditions, marine and freshwater habitats of Turkey. It includes new parasitic copepod species records with host according to changes in classification.

Several studies on diversity of parasitic copepods in fish from freshwater and marine water habitats have been studied in the world (Dippenaar, 2005; Benmansour and Ben Hassine, 1997; Avenant-Oldewage and Oldewage, 1993; Barzegar and Jalali, 2009; Holland and Kennedy, 1997; Radujkovic and Raibaut, 1989; Ramdane and Trilles, 2010; Bakır et al., 2014; Khamees et al., 2015; Luque et al., 2013; Morales-Serena et al., 2012; Raibaut et al., 1998).

Fish-parasite checklist studies are important taxonomic documents obtaining the fish-parasite relationships, host selectivity and geographic distribution of fish parasites. They may contribute as baseline data in the disciplines of parasitology, zoology, medicine, environmental science in terms of determining biological diversity, treatment and control of parasites, identification of parasite, determining host selectivity and geographic distribution of fish zoonoses, compare of fish parasite fauna of local, regional and worldwide (Alaş and Öktener, 2015).

Online databases about flora and fauna were created by both civil society organizations and international science centres in a virtual environment developing with the information age. Online database such as ITIS; Fishbase, WoRMS, shark-references.com, etc., can contribute to the demonstration of biodiversity, taxonomy of the species of the existing flora and fauna and their geographic, the provision of bio-ecological characteristics, also fulfils a really important task by revising and updating the addition of new species presented to the scientific world (Alaş and Öktener, 2015).

Checklist studies about fish parasites can give information of host specificity, geographic distribution, bio-ecological characteristics between parasite and host. They may constitute a source for scientists as zoologists, parasitologists, ecologists, etc., working about fish parasites and also useful in minimizing of doubtful, error reports and notifications of both the parasite-host. Checklists are important in achieving all of data about parasite and hosts among the countries at a glance. But, you know that valid names and synonymies of parasite and host species may be changed. Reports of parasite findings may be published at different/same dates and regions by different researchers. Some information can not be reached. Although checklist studies are important, they need to revise and update and it must be delivered to many readers. In this sense, checklist studies may contain little restrictive and not current information, hence these constitute disadvantages. Therefore, we want to specify the examples that the opinion that the more efficient the database (Alaş and Öktener, 2015).

Ecological conditions, habitat properties and fish diversity can be different in each country. For these reasons, data obtained from various countries cannot be compared with each other. Our aim is to reveal the parasitic copepod diversity for fishes in Turkey.

ACKNOWLEDGEMENTS

The author thank to the anonymous reviewers and the editors of *Transylvanian Review of Systematical and Ecological Research* for the valuable, critical and helpful comments on the manuscript.
